Multivariable controllers are most common in the petrochemical, aeronautical, and energy industries. In a distillation column, for example, there can be hundreds of temperatures, pressures, and flow rates that all must be coordinated to maximize the quality of the distilled product.

In conventional model-based multivariable control, model-related activities account for 90% or more of engineering and maintenance costs, yet nearly all reliability and performance issues continue to be attributed to poor model quality, with little reason to expect this to change (Control Engineering, September 2018, “ The big story behind auto-tuning ”).

Multivariable control is a technique that allows us to deal with more than one control objective at the same time. For a particular piece of equipment or a process unit, two or more variables, so-called controlled variables (Cs) must be kept at their target values, their setpoints.

This course is designed to provide a graduate level introductory treatment of the theory and design of multivariable linear time-invariant (LTI) control systems. The course provides students necessary background needed to understand and to apply the modern H-infinity control theory and mu-synthesis based robust control design techniques.

The multivariable predictive controller (MPC) is a multivariable controller (MVC) that controls several process variables simultaneously by adjusting several manipulated variables at once.4 MPC has become a widely-adopted control technology, and benefits are commonly understood and documented in the processing industries, in refineries, gas plants, chemical plants and recently in oil production facilities.
